Introduction of site-specific mutations into the genome of

Abstract. We have developed a method for introducing mutations into the adenovirus type 2 genome at predetermined sites. Specific mutations are introduced into segments of the viral genome cloned in bacteria by using plasmid vectors.

of efficiently introducing specific mutations into the chromosome is often the first essential step of the postgenomic approaches aimed at understanding bacterial biology and virulence. This allows the development of new genome-based vaccines and antimicrobials. In vitro mariner transposition represents a powerful and rapid tool for inser-

PDF | We have introduced two specific point mutations, located 20 base pairs apart, into the endogenous murine gene that encodes the largest subunit of RNA polymerase II (RPII215).

Superinfection with helper virus lacking the WSN NA gene resulted in the release of virus containing the WSN NA gene. We then introduced five point mutations into the WSN NA gene by cassette mutagenesis of the plasmid DNA. Sequence analysis of the rescued virus revealed that the genome contained all five mutations present in the mutated plasmid.
