Ceramides are a family of waxy lipid molecules. A ceramide is composed of sphingosine and a fatty acid. Ceramides are found in high concentrations within the cell membrane of eukaryotic cells, since they are component lipids that make up sphingomyelin, one of the major lipids in the lipid bilayer. Contrary to previous assumptions that ceramides and other sphingolipids found in cell membrane were ...

This is because of the divergence observed in these virus antigens, and particularly the low homology of the available sequences. [3,4,5] In our previous work with heterothermic animals, such as snakes (genus Bothrops and genus Crotalus) and toads and frogs (genuses Bufo and Rana) all animals investigated were shown to have receptors in their red cells and antibodies specific to the influenza ...

Euglena is a large genus of unicellular protists: they have both plant and animal characteristics.. All live in water, and move by means of a flagellum.This is an animal characteristic. Most have chloroplasts, which are characteristic of algae and plants.. Euglenids are believed to descend from an ancestor that took up green algae by secondary endosymbiosis.

Euglena - Simple English Wikipedia, the free encyclopedia

Basic principles of cryopreservation 89 and their membrane surface area (volume to surface area ratio), and by the permeability of the membrane to water and to cryoprotectant (see Figure 9).

Section 7 Basic principles of cryopreservation

We introduce aldehyde-stabilized cryopreservation (ASC), a brain-banking technique for preserving detailed brain ultrastructure over long time scales.
